

Multi-objective global routing for IC design automation

Gleb Zaglyadin

Moscow Institute of Electronic Technology
(Technical University)

Main objectives

- Local density → Total wire length and Timing decrease
- Total wire length → Local density and Timing decrease
- Timing → Total wire length and Local density decrease

Approaches

- Sequential optimization
- Multiobjective function

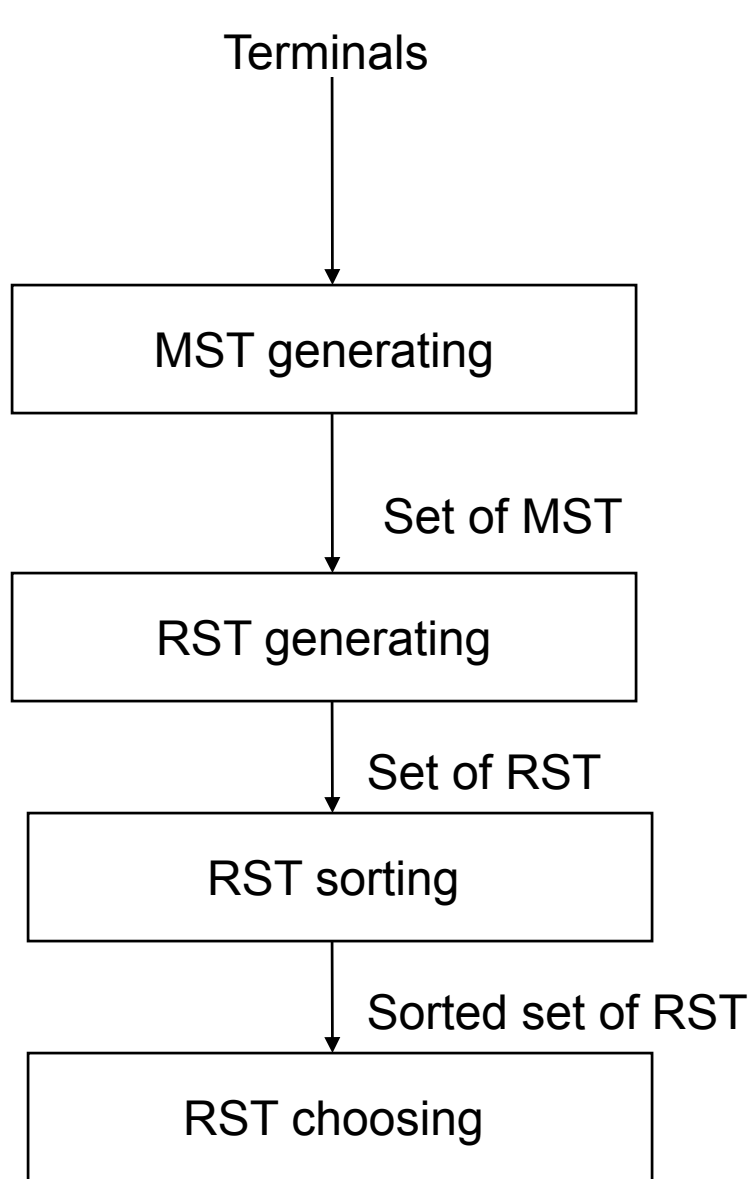

Weak points:

- Local optimization
- Results degradation
- IC's architecture adaptation
- User's refinement

Main idea

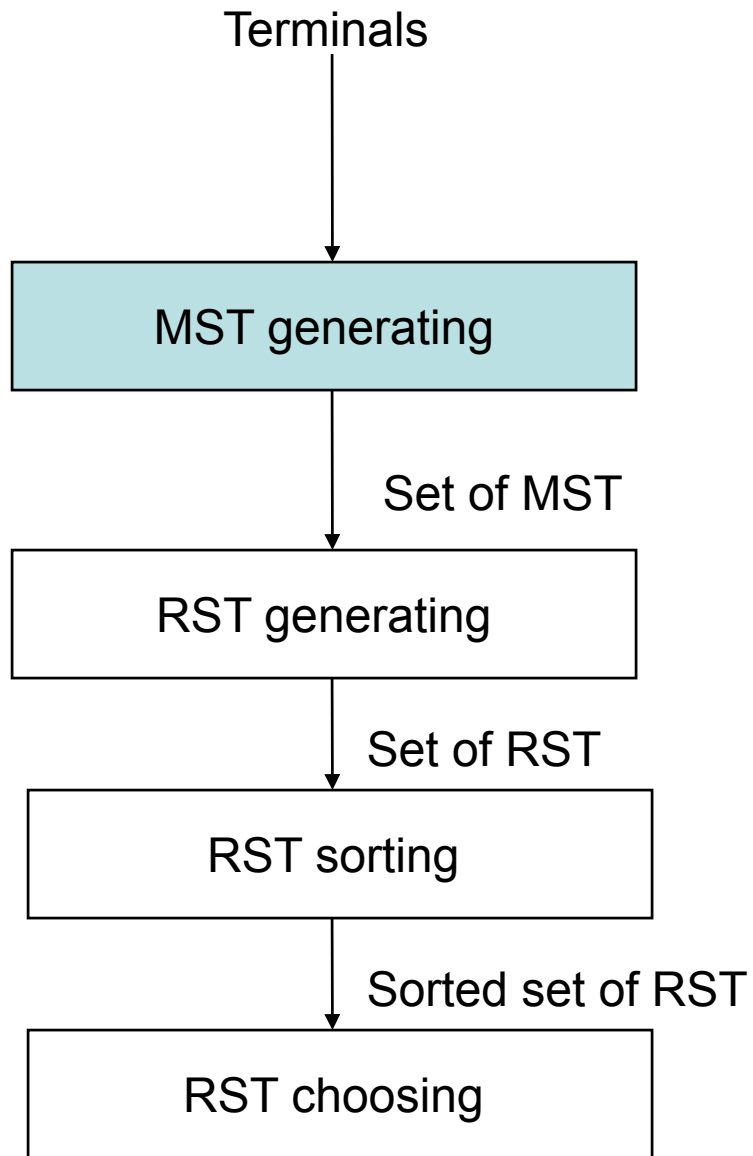

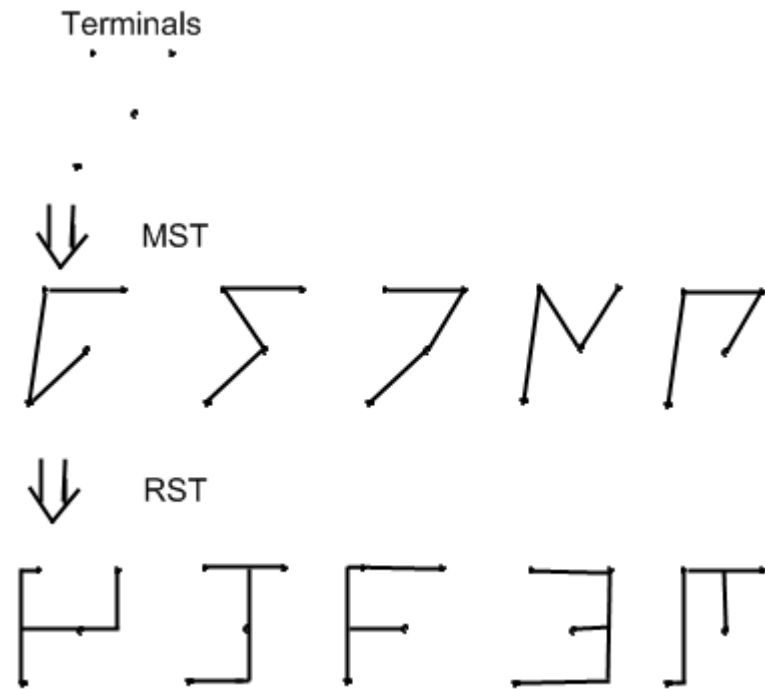

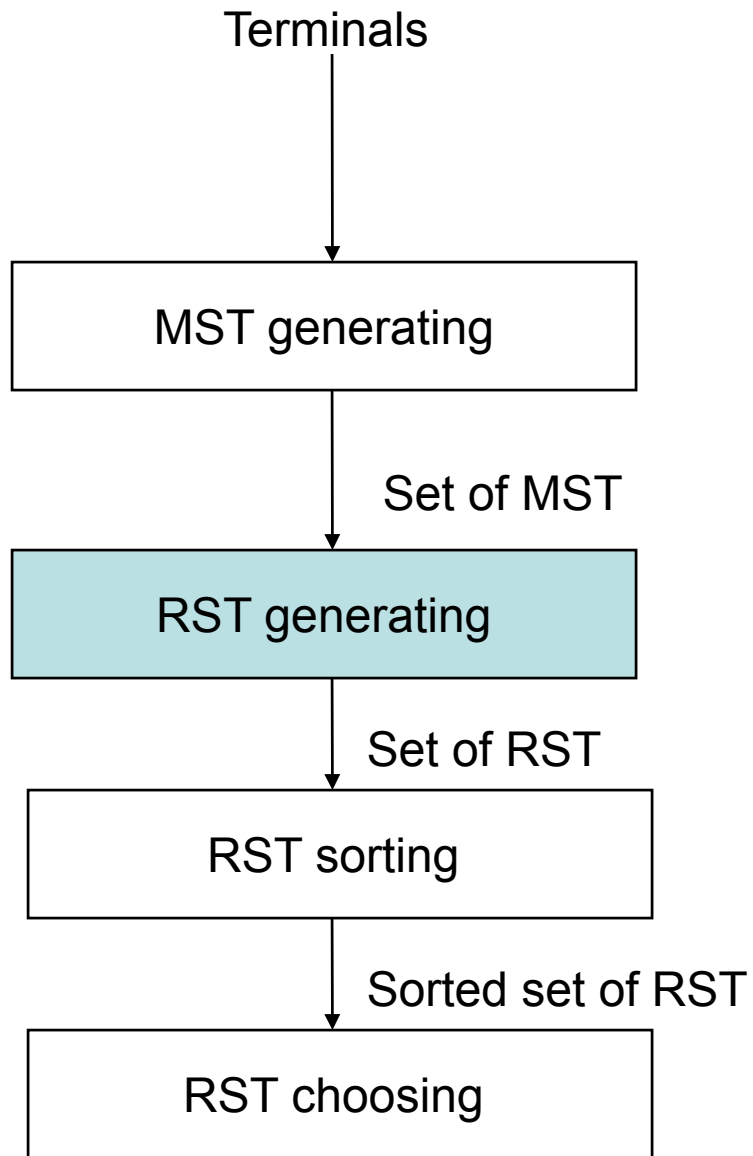

- Sets of SMT(Steiner Min Tree)
- Density decrease

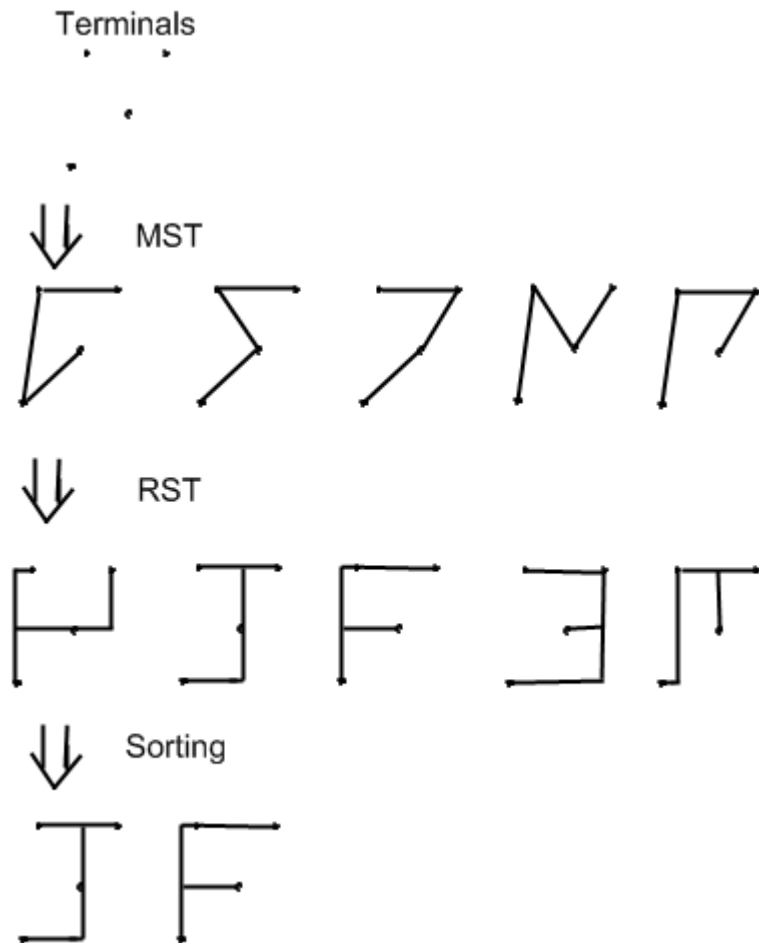

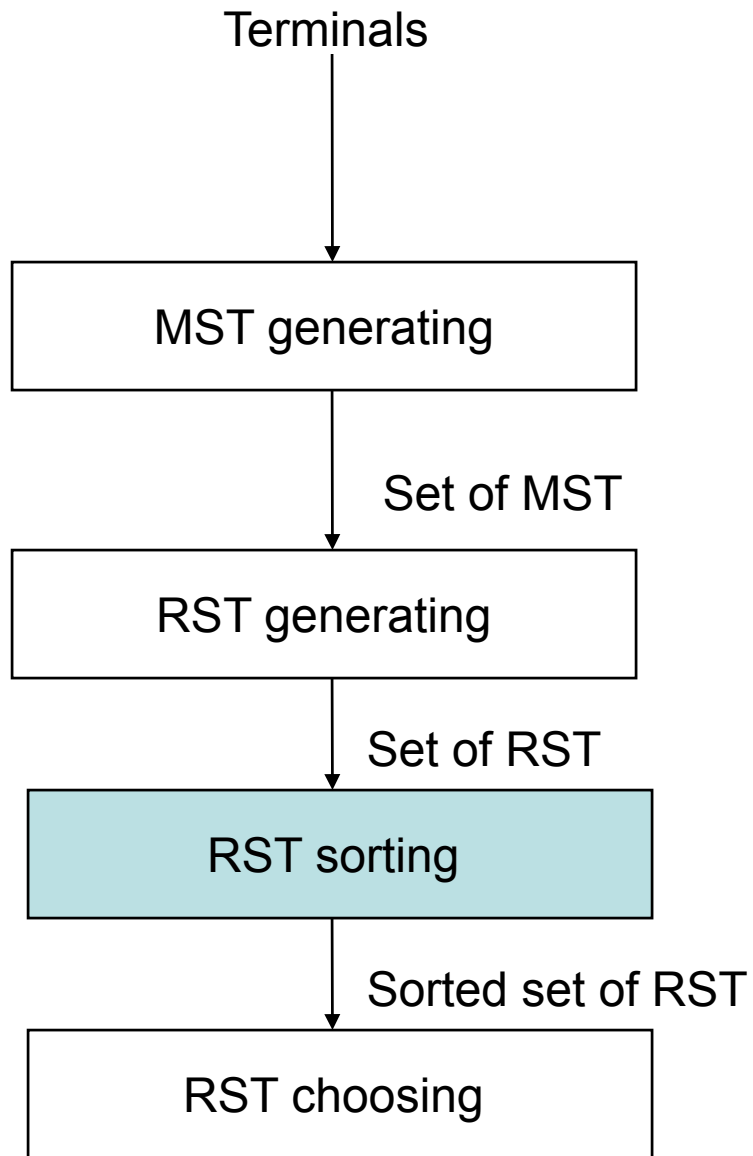

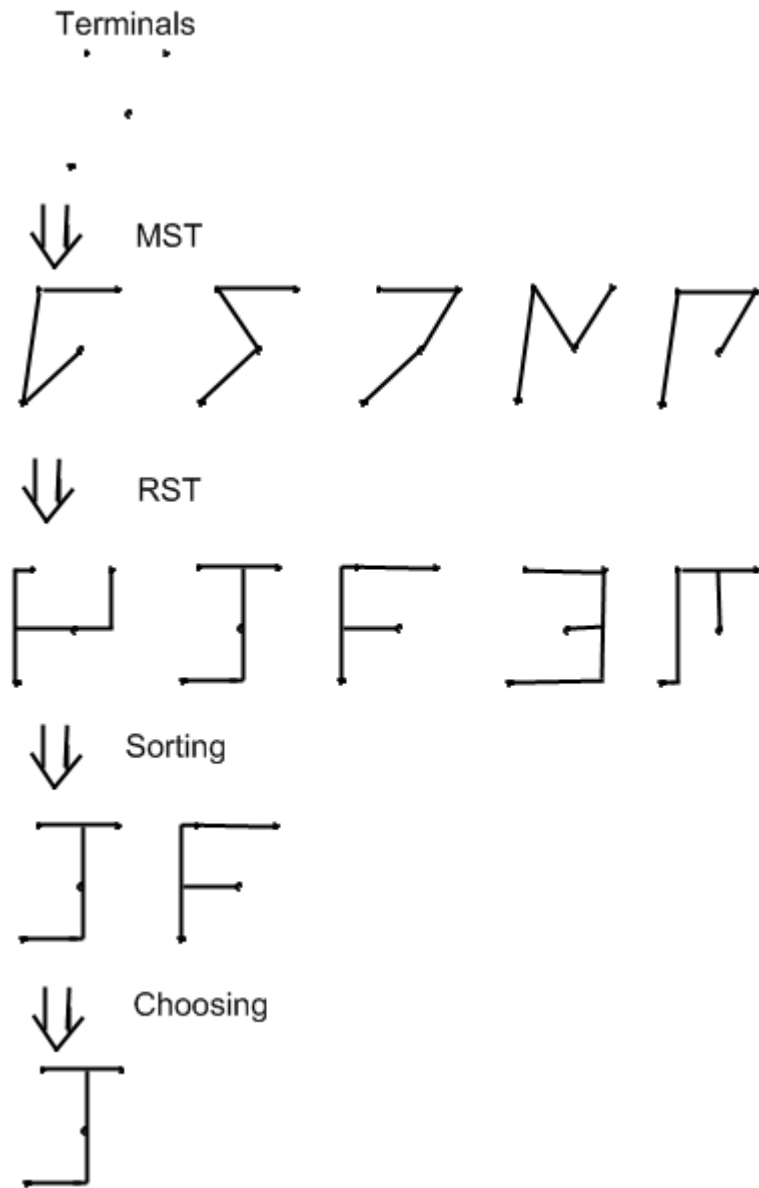

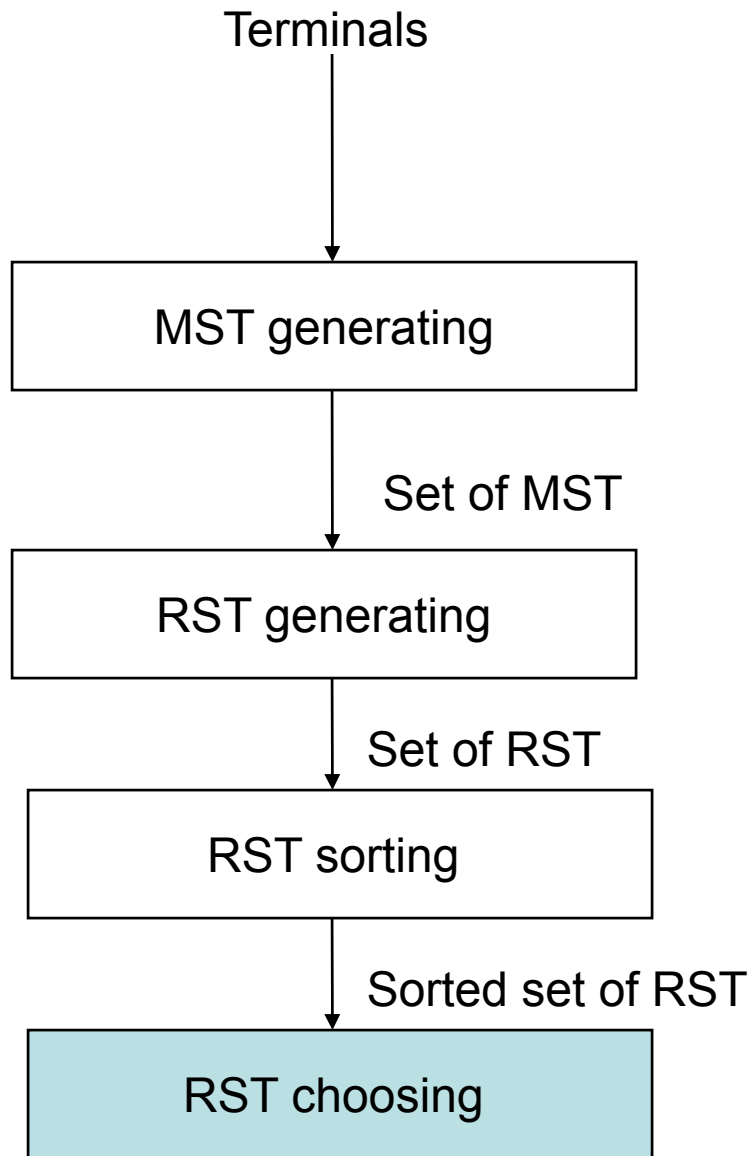

Terminals

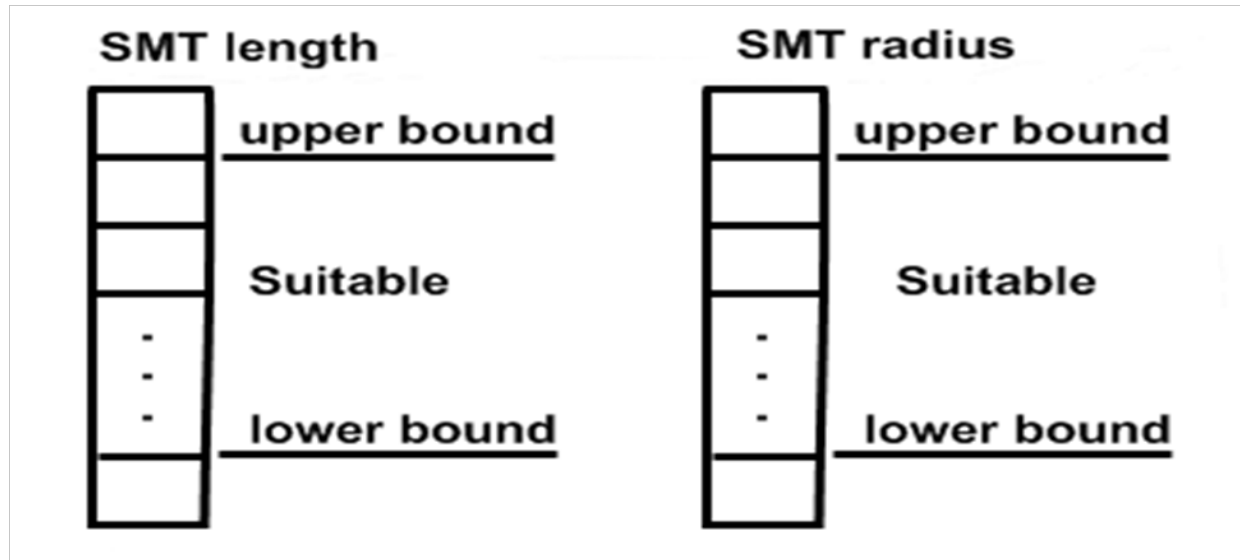

MST generating

$$\text{MST} \rightarrow \{\text{MST}_i\},$$
$$\text{Cost}(\text{MST}_i) - \text{Cost}(\text{MST}) \leq \Delta$$

- Modified Kruskal's algorithm
- Timing
- Wire length

SMT sorting

- Balanced tree
- Flexibility
- Complexity decrease

Thank you for attention
